Overview...

Once you have the page the way you want it, you are ready to post it for all to see. There are several methods with which to post pages. Regardless of where you are posting, Dreamweaver provides a handy tool to help you with this process. In this section we will go through the steps necessary to put a web page online using Dreamweaver.

Manage Sites Window

From Site in the main toolbar, select Manage Sites...
1) Find your site in the list. In this example there is only one site, "Tutorial"
2) Then click Edit...
1) Select **Remote Info** on the left, and enter the relevant information. The information you enter varies, depending upon the system from which you are connecting, and whether you are posting to the College's official web server (www.usu.edu), posting to the student web server (student.usu.edu), or posting to another web server at USU or elsewhere.

2) Make sure you enter the correct **Access** method server name or location. In most cases you will want to access the web server via **Local/Network**. However, if you are off-campus, you may need to
access via **FTP**. Either way, you need a valid password to access the server. If you are accessing the server via **Local/Network**, you may also need to mount the server before you can set up or use the Dreamweaver site management tool.

**Connect And Upload**

In the bottom right of the screen you’ll see a window with the 1) *Connect* icon
Once you have set up all of your info from the previous step click the *Connect* icon.
2) Upload files
3) Download files
