Introduction

Every year students encounter the same topics. The branches of government, punctuation, food groups, etc., are repeated in several grades and more than one subject. While students may successfully learn the same topics year after year, there does not seem to be enough attention given to the process of learning how to learn. Without knowing how to learn, students will find it difficult to transfer what they have learned to new but similar learning tasks.

This fastback attempts to overcome that shortcoming. It identifies the areas that “connect” subjects and grades. It also provides resources and strategies that will help students become independent learners.

This fastback discusses the 14 Connections. They are called “Connections” because they consider the repetition of topics in education and connect these topics within and across grades, subjects, and subtopics. But most important, using these Connections will help students learn how to learn.
Fourteen Connections

There are 14 Connections that encompass everything that is to be taught or learned. These are called “connections” for a number of reasons. They connect topics that are repeated for study within and throughout the grades. They connect studies that are related across subject areas. They connect the multiple subtopics that are found in the same category. They connect the relationships between the content and process outcomes. And they connect the processes that aid students in learning how to learn.

The 14 connections are:

- **Actions**: Usually take time and consist of more than one act or event.
- **Event**: An occurrence, especially one of some importance. Occurs in a certain place during a particular interval of time.
- **Idea**: Any concept existing in the mind as a result of mental understanding, awareness, or activity.
- **Issue**: A point in question. A matter that is in dispute or under discussion. A basis of debate or controversy.
• **Object:** Anything perceptible by one or more senses, especially anything that can be seen or felt; a material thing.

• **Other Living Things:** Anything living of a nonhuman nature.

• **People:** All of the persons constituting a community, tribe, family, company, race, or nation because of a common culture, history, religion, interests, or the like.

• **Person:** An individual human being.

• **Place:** A particular portion of space, whether definite or indefinite.

• **Problem:** Any matter involving doubts, uncertainty, or difficulty dealing with choices of action that are difficult either for an individual or society. Also a matter for which known strategies or methods are inadequate.

• **Process:** A systematic series of actions directed to the same end. A continuous action, operation, or series of changes taking place in a definite manner. A series of progressive and interdependent steps by which a result is obtained.

• **Situation:** A state of affairs or combination of circumstances at a given moment.

• **System:** An assemblage or combination of things that form a whole or that operate in unison. An ordered and comprehensive assemblage of facts, principles, doctrines, or the like, in a particular field of knowledge or thought. A coordinated body of methods or a complex scheme or plan of procedure. Any method or plan of procedure. A method or
scheme of classification. The structure or organization of society, business, or politics.

- **Theme:** The subject of discourse, discussion, meditation, or composition.

Using the 14 Connections will help students transfer knowledge and processes to new learning. The ability to categorize any topic into one of the 14 Connections will enable students to identify and apply strategies of learning about the Connections. Each learning experience about the Connections will become cumulative. When students practice using the strategy for studying a topic in a specific Connection, they will be able to recognize that similar approaches can be used to study any item that can be categorized into that Connection.

**General Strategies**

The strategies of the 14 Connections use the common elements that exist in various topics. These strategies make learning cumulative by not only having students learn the desired information about one topic, but also allowing them to apply that same learning to any similar topic.

In order to transfer knowledge from one topic to similar topics, students must understand "repetitive parallelism." Repetitive parallelism occurs when there are a number of repeating examples within the topic being studied. For example, when studying the 13 Colonies, there will be many aspects that repeat from one colony to the next. The students might need to know about each colony's agricultural products or forms of government, for example.
When a topic is introduced, it might fit easily into a number of Connections. The traditional approach would be to have all students study a little part of all the categories — an overview approach. But studying one Connection gives the students the opportunity to select the approach they prefer.

The first step students should take when they are introduced to a new topic is to brainstorm answers to the question “What do you know?” Depending on how much previous exposure to the topic that the students have, they may have to move on to the question, “What do you think you know?” Other questions that can start the initial brainstorming activity are “What do you want to know?” and “What do you feel or believe?” Students should ask these questions whenever they study a new topic. The first question makes them recall any facts they have already learned, while the second question allows them to guess. If their guesses are wrong, they can be used to demonstrate opportunities for learning.

After working individually, the students can combine into groups to share their answers, then each group shares answers with the rest of the class. When the entire class has shared their answers to these questions, all students know what each knows about the topic and are ready to move on.

The answers that come from these questions are the basis for creating more specific questions that link the content being studied to the Connections. For example, when studying a topic under the Connection, place, one of the specific questions is, “Where is it located?” Brainstorming these specific questions gives direction
and sets goals for the study. Often the specific questions can be put in a handout to serve as a study guide on a topic. Sample specific questions for each Connection are included in the Appendix.

In answering these questions, the students learn to distinguish between “specific” and “general” knowledge. Specific knowledge is that which is applicable only to the study of that particular topic. General knowledge can be used to study any topic that is categorized into the same Connection. Students need practice in recasting the specific characteristics into more general terms. In this way, whenever students encounter a new topic, they can use their previous experiences to advance their understanding.

**Schematics**

In order to use the strategies of the 14 Connections, students need to produce “schematics.” While students should produce a new schematic for each Connection, each schematic will follow the same pattern.

Each schematic has four parts. Part one simply identifies the Connection. Is it a *place*? An *issue*? A topic may fit into one or more Connections, but only one Connection should be selected by the teacher or student.

Part two of the schematic is a list of the “characteristics” of a Connection. For example, for the Connection, *object*, the characteristics could be: form, color, size, function, value, etc. These general characteristics are developed after the initial student brainstorming has taken place.
Part three lists the "types" of what is being studied. For example, for the Connection, place, the types might be homes, cities, colonies, regions, etc. The types listed in the schematic are the first repetitions usually found in schools. Thus in history classes in different grades, students might study different religious groups. Students will find it easier to learn about these groups when they understand that there are general aspects that all groups have in common.

The characteristics of a Connection usually are fairly specific because they apply directly to what is being studied. The types are more general because they include all similar items to the one being studied.

For the fourth part of the schematic, students list very specific examples. Thus if students were studying the systems of the human body, one type might be "the digestive system." For the fourth part of the schematic, the students would list the many parts of that system.

The schematic should be treated as a developmental task. Students brainstorm their lists as topics are introduced. This practice also helps students to see that many topics can be studied in the same way.
Introducing the First Connection

There are seven instructional strategies that teachers need to understand before they are ready to work with the 14 Connections. They are:

- Strategies for working with the students' initial brainstorming efforts.
- Alternative strategies for assigning work with the Connections.
- Alternative strategies for assigning work with the specific questions.
- A strategy for answering the question, "Are there some things that all students should know?"
- Working with the concept of "repetitive parallelism."
- A description of the concept of "practice learning."
- The use of starter examples for serving as the basis for questions that will lead to higher-level thinking.

These seven strategies will lead the students to understand how the Connections can help them study almost all their subjects in any grade. They also will help
students to become more involved in decisions about their education and will provide a process for learning how to learn about anything that they can relate to one of the Connections.

All studies begin with students brainstorming by using one of the four questions discussed earlier. If the issue, problem, or situation is familiar to the students, the first two questions are used: What do you know? What do you think you know? If the topic is not familiar, the third question is used: What do you want to know? In many cases, the issues, problems, or situations will call for the fourth question: What do you feel or believe?

The students' individual brainstorming always is followed by sharing within and among their groups. When the students have brainstormed for a while, the teacher helps them to understand the difference between special and general knowledge.

There are many approaches that can be applied to the use of the Connections to allow for variety in the classroom. The teacher can assign these approaches to small groups or to individuals, or the students may be allowed to choose their own approach. Since students will be studying a Connection many other times, they can choose other paths of study later. This reduces the common student complaint that “We studied that before.”

After the topic to be studied is chosen, the students use the four basic questions to generate a list of more specific questions. There are many strategies for using these questions. Some of them are:
1. Assign to the whole group all of the questions generated by the students in answering the question, "What would you like to know?"
2. Assign some questions to all of the students and let them generate a few additional ones on their own.
3. Allow each student or small group of students to choose a given number of questions for study.
4. Assign groups of questions to particular groups of students.
5. Have each student write a number of their own questions and then be responsible for their own answers.
6. Have each student write a number of their own questions, then exchange them with questions from other students.

Special attention can be given to student-generated questions that call for higher-level thinking or application beyond just answers that rely on memory.

In designing their own questions, students will come to realize that some of their answers may not be found in their texts. This is an important lesson to be learned about any text.

It is important to remember that there are some things that all students should learn from a lesson. For most topics, these basic facts are the answers to the "six W's," the questions familiar to most journalists: Who? What? When? Where? Why? and How? These questions can be given as an independent assignment for all students to answer, and students can be tested on these facts.
“Repetitive parallelism” is a common factor in all the Connections. Whenever two or more topics are studied under one Connection, there are common characteristics that can be used to study each of them. For example, when studying the 13 Colonies, each colony can be seen as a topic under the Connection, _place_.

One instructional strategy that takes advantage of repetitive parallelism is to place each item, such as the 13 Colonies, on one side of a grid and a series of questions, such as the “six W’s,” across the top. Not only does this approach help students learn the basic facts they need to know; it also teaches them that there are commonalities among all the topics. The questions can be used to ask basic factual questions or to have students engage in higher-level thinking, such as asking students to draw conclusions, make generalizations, and make inferences.

Another important concept is “practice learning.” Just as lawyers and doctors refer to their “practice” in law or medicine, teachers might consider referring to their roles as “practicing teaching.” The same principle is involved: learning on the job. If it is good enough for those professions, why is it not good enough to think about the concept of “practicing learning” for students?

Too often students are evaluated on a one-time learning situation, the teach-test-reteach strategy. A “practice learning” opportunity should precede the evaluation process. This process can be used in each of the introductory lessons to each of the 14 Connections.
When the class is studying several topics under one connection, a useful strategy is to allow students to choose which one of the subtopics that they want to study. The students, either in small groups or individually, are asked to prepare presentations about their study. Time is provided for their planning, access to the library, and for giving their presentation. This part of the strategy is free from grading because this is the practice round. However, students evaluate their own work with such questions as:

- Did you meet your goals?
- How well did you work together?
- Did your plan work?
- What would you do to improve your work, product, or presentation?
- What ideas did you learn from the other groups’ presentations?
- Did you use your time efficiently? If not, how could that be improved?
- What did you observe that would be of value to your own study?

In addition to their self-evaluations, the students should be given an opportunity to critique other presentations with such questions as:

- What would you suggest to improve?
- What did you learn from the presentation?
- Was it evident that the group had planned well together?
• Did all members have a part?
• Was it well organized?

Once the students have been through the self-evaluation and the viewers’ critiques, the teacher offers the choices for studying the remainder of the subjects. This part will be graded. This provides an opportunity for the students and teacher to establish criteria for the second round of studies and presentations. Thus all students know from the outset how their products and presentations will be evaluated. Again, their choice is to work in a group or as an individual.
Using Connections

This section provides a detailed study plan that can serve as a guide for all the Connections. It uses the Connection, place, because it includes topics that are studied in every grade and many subjects. While many places can be chosen, the place of Iceland has been chosen for this exercise.

There is no particular order to the sequence in which the Connections are studied. Each Connection stands alone and follows the same pattern of development as the others do.

Introducing the Process

Teacher: How many of you have read or studied about Iceland? When we begin the study of something new or nearly new, we can begin by using one or more of the four Basic Questions. They are:

- What do you know?
- What do you think you know?
- What do you want to know?
- What do you feel or believe?
The first two questions go together. I would like each of you to write three things that you know or think you know about Iceland. (Note: The second question is very important. It indicates to the students that it is all right to guess and, even more important, to guess and possibly be wrong.)

Now share your ideas with those students around you. Add any other ideas as you work together. (An idea might be to have small groups of students use a “web” approach, with “Iceland” written in the middle and the shared items listed around the outside. If possible, chart or butcher paper can be used.)

Now I'd like the groups to share your combined lists. You can add to your lists from other groups' contributions.

Distinguishing Between Specific and General Knowledge

Teacher: There are two reasons for learning about any place. One is to learn facts, data, or information about it. This is called the content. The other is to learn a process for learning about a place. Let’s see how those two reasons relate to the study about Iceland.

Let’s see if we have a real reason for studying Iceland.

- Are you planning to go there for a visit, vacation, business, or to live?
- Is there a major event taking place there?
- Is Iceland part of your ancestry?
- Is a member of your family being assigned or stationed there?
  Are you going to have a visitor or house guest from there?
• Do you have a personal interest or want to become an expert about Iceland?
• Do you have a pen pal or e-mail friend from there?

(In most cases the answers to those questions will be “No.”)

Since there doesn’t seem to be a real reason for studying this place for its content only, let’s examine the other reason for studying Iceland.

(As the answers to the following questions are given, they are added to the students’ brainstormed lists.) I see some of you have listed island / fishing. If Iceland is an island, what do we know about islands? What industries do you think would be there? What other industries might there be because of fishing? What do we get from fish?

Any answers that are true only for the study of Iceland are called “specific knowledge.” If we were studying another place that was near water — such as a river, lake, or ocean — which ideas could we use again? Since we will be able to use this information again, these items would be examples of “general knowledge.” Can somebody think of a statement we might use to think about specific and general knowledge?

Because Iceland is near water, any place that you study that is near water probably will have fishing as an industry or, at least, as a popular form of recreation. They probably also will get similar products from fish, and there is a great chance that they will have related industries that are similar to those in Iceland.
Expanding General Knowledge

Teacher: Take the list you made to answer what you know about Iceland and look at the items on the list. You will notice that many of the items are specific knowledge about Iceland. Now take those items and name the larger, general categories to which they belong. For example “fishing” would fall into the category of “industry” or “recreation.” “Cold” fits into “climate” or “weather,” “Vikings” into “people.” Complete categorizing the other items on your charts.

(This activity will result in a preliminary list of the characteristics and types for the Connection, place. A full list would be made only after multiple sessions in studying that particular Connection.)

Teacher: Think about any place in the world where you would like to go. Substitute it for Iceland. Do you see that the categories that you have identified for Iceland can now be applied to your study of the new place?

Let’s review the process that we used to study Iceland.

Step 1: We listed what we knew and what we thought we knew.
Step 2: We shared our lists with others.
Step 3: We shared the groups’ lists.
Step 4: We identified specific and general knowledges.
Step 5: We translated the specific topics into their larger categories.
Step 6: We substituted the name of any “place” for Iceland and used its general categories as a study guide for anything that can be categorized as a place.

Anytime something can be identified as a place, you can use this process to help you learn about it.

Extending the Lesson

Teacher: Now that we have learned how to study about a place, let’s look at the list you generated to answer the question, “What do you want to know?” Your list of questions can be used as a study guide.

What do you want to know?

- What is its history?
- Where is it located? How do you get there?
- How big is it?
- What kind of government does it have?
- What do people there do for a living?
- What is its weather like?
- Who found it? When?
- Is it part of a larger place?
- What are its flora/fauna/natural resources?
- How does it depend on other places?
- How has the place affected people?
- Are there any dangers/problems?
- Why would someone want to visit there?
- Why would someone want to live there?

Now we can use the lists we made to begin our study of Iceland to find out if what we knew or thought we
knew is true. This list can be used any time you need to learn about a place.
Conclusion

As students move through the grades, they will face numerous things they need to learn that are very similar to things they already have learned. Whether they need to learn about an issue or idea, person or problem, there are many aspects of the new learning that will be familiar to the students. Students need a way to recognize these similarities and to use what they already know to learn the new topic.

All of the 14 Connections are used in the same manner. When a topic is presented for study, the students decide what Connection it fits into. Is it an object? A system? After the students decide on the Connection, they then answer one or more of the four Basic Questions: What do you know? What do you think you know? What do you want to know? and What do you feel or believe?

After students list their the individual responses, they are asked to pool their responses within their group and to add any others that come to mind. Then they will share their responses among the groups. From these lists are selected the specific questions that will guide their study.
By recognizing the commonalities in learning, students will come to understand that what they already have learned will help them to learn new things. That is, they will have learned how to learn.
Appendix

The Appendix includes lists of the specific questions that will guide learning in each of the 14 Connections. It also includes lists of "Characteristics" and "Types" for each Connection.

The study questions listed in this appendix were derived by having hundreds of teachers in workshops and graduate classes brainstorm to answer the question, "If you were going to study this topic, what questions would you ask?"

These are not lists to be memorized, but are to be cumulatively developed as students study the same Connection as they encounter it in different subjects and different grades. The lists can be used as references for students after they have had a few experiences with the Connections. These lists are offered as starter ideas.

What do you want to know?
What are their origins?
What are their customs or traditions?
What is their location?
What is their language?
What is their religion?
How are they governed?
What are their homes like?
What do they eat?
What do they do for recreation?
What is the population size?
Person

Characteristics

Male/Female  Time period
Parents  Contributions
Major actions  Occupation
Avocations  Other family members
Critical Influences  Positive/Negative characteristics
Ideology  Philosophy
Morals  Values
Anecdotes  Influence on others / events / me
Ancestry  Religion
Economic situation  His / her heroes, mentors, leaders
Achievements
Any handicaps

Types

Political leader  Societal leader
Military leader  Educator
Scientist  Business leader
Industrialist  Farmer
Aerospace leader  Religious leader
Home person  Author
Artist  Parent
Child(ren)  Judicial person
Laborer  Builder
Entertainer  Service person
Salesperson  Government leader
Inventors  Discoverers
What do you want to know?
- What was his or her importance?
- What was his or her occupation?
- What influence did he or she have on others?
- Is the person still living?
- What were some critical life events?
- What is an outstanding period of his or her life?
- Where did he or she live?
- When did he or she live?
- What was his or her family background?
- Who influenced him or her?
- What education did he or she have?
- Did the person’s sex influence his or her life?

What do you want to know?
What is the problem?
To whom, what is it a problem?
Why is it a problem?
What are some probable causes?
Who, what is involved, affected?
How serious is it?
Why is it necessary to solve the problem?
What would happen if nothing were done?
Can the problem be solved?
What is necessary to solve the problem?
Who will be affected by the various outcomes?
When is it necessary to solve the problem?
What is your reaction to the problem?
What are others' reactions to the problem?
What are the pros and cons of each position?
Which elements are objective, emotional?
What have been similar problems in the past?
How have similar problems been solved in the past?
How could similar problems be avoided?
What are the costs of each of the alternatives?
What resources are needed to solve the problem?
How are people currently coping?
Are policies involved?

What do you want to know?
Why should it be studied?
How is it relevant to our lives?
What are the outcomes of the study of it?
Does it repeat in history?
What does it mean to you?
What are examples of it?
Under what conditions does it apply?
Does the discussion raise any fears?
How does the discussion of this theme help you?
Does the discussion of this theme give you any new insights/ideas?
Did the discussion change any of your ideas?
What do you understand now that you did not before?
Why is the discussion of themes valuable?

Phi Delta Kappa Fastbacks

This series, published each fall and spring, offers short treatments of a variety of topics in education. Each fastback is intended to be a focused, authoritative work on a subject of current interest to educators and other readers. Since the inception of the series in 1972, the fastbacks have proven valuable for individual and group professional development in schools and districts and as readings in undergraduate and graduate teacher preparation classes. More than 450 titles in the series have been published, and more than eight million copies have been disseminated worldwide.

For a current list of available fastbacks and other publications, please contact:
